數字媒體軟件與系統開發

干皓丞, 2101212850, 信息工程學院 2022 年 3 月 29 日

1 作業目標與章節摘要

FFMGEG下載,並說明 output_example。

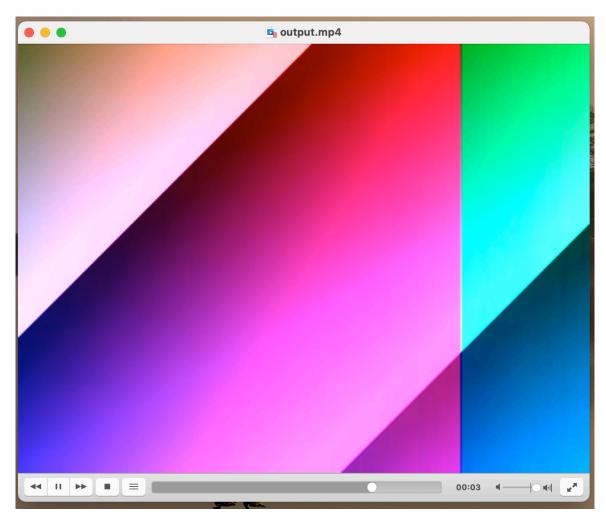

Fig. 1. 最後測試結果

2 文章與作業狀況

作業可以從 GitHub 下的 kancheng/kan-cs-report-in-2022 專案找到,作業程式碼與文件目錄為 kan-cs-report-in-2022/DMSASD/ffmpeg。實際執行的環境與實驗設備為 Google 的 Colab 、MacBook Pro (Retina, 15-inch, Mid 2014) 、Acer Aspire R7 與 HP Victus (Nvidia GeForce RTX 3060)。

https://github.com/kancheng/kan-cs-report-in-2022/tree/main/DMSASD/ffmpeg

3 作業內容概述 2

3 作業內容概述

此作業分為二大部分,第一部分說明前置準備與分析專案,第二部分則描述 output-example 原始碼與測試該過程,最後補充 /doc/example/muxing.c。

- 1. 前置準備與分析專案
- 2. output-example 原始碼與測試該過程
- 3. /doc/example/muxing.c o

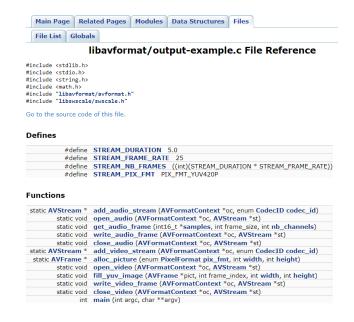

Fig. 2. 官方文件

4 前置準備與分析專案

其官方文件、原始碼檔案與相關連結如下:

4.1 Cloc 分析 FFMPEG

將下載來的原始碼進行 cloc 指令與結果分析

```
1 cloc .
1 (base) PS D:\FFmpeg-n3.0\ffmpeg-raw> cloc .
2     7698 text files .
3     4341 unique files .
```

4 5	3359 files ignored.

4.2 Mac 編譯 FFMPEG

嘗試用內部的 configure 進行編譯。

```
1 ./configure --disable-x86asm
2 ffmpeg
```

當然不用編譯,也可以使用 brew 等工具安裝現有編譯好的 FFMPEG。

```
(base) HaoyeMacBookPro:ffmpeg kancheng$ ./configure --disable-x86asm
install prefix
                           /usr/local
source path
C compiler
                           gcc
C library
ARCH
                           x86 (generic)
big-endian
                           no
runtime cpu detection
                           yes
standalone assembly
                           no
x86 assembler
                           nasm
MMX enabled
                           yes

Hyper fast Audio and Video encoder
usage: ffmpeg [options] [[infile options] -i infile]... {[outfile options] outfile}...
 Use -h to get full help or, even better, run 'man ffmpeg'
```

Fig. 4. 編譯成功

4.3 output-example.c 版本

已知社群中文素材所找的內容,其實時間大多為 2010 左右,而該範例原始碼於 0.6 還可以找到,但在 0.7 版此檔案就已經被拔掉,其大的版本可以在 v0.6.1 中下載。

從 GitHub 的版本號中可以看到是由 Michael Niedermayer 所提交的合併更動時消失。在此可以用指令將下載來的 FFMPEG 匯出 Git Commit 紀錄,來追專案的變化

將所有 Log 紀錄用指令輸出至一個 txt 檔案中。

```
1 git log > log.txt
```

接下來發現 Michael Niedermayer ,FFMPEG 的專案開發者的相關批改,也就是在這個合併後,該檔案就沒再出現了。

```
commit fbe02459dc4f3c8f4d758c1a90ed8e35a800f3b9
1
   Merge: 9a1963fbb8 b4675d0fbf
   Author: Michael Niedermayer < michael@niedermayer.cc>
3
4
   Date:
           Mon Jul 16 01:32:52 2012 +0200
5
       Merge remote-tracking branch 'qatar/master'
6
7
       * qatar/master:
8
         configure: Check for CommandLineToArgvW
9
         vcldec: Do not use random pred_flag if motion vector data is skipped
10
11
         vp8: Enclose pthread function calls in ifdefs
         snow: refactor code to work around a compiler bug in MSVC.
12
         vp8: Include the thread headers before using the pthread types
         configure: Check for getaddrinfo in ws2tcpip.h, too
14
         vp8: implement sliced threading
15
         vp8: move data from VP8Context->VP8Macroblock
16
         vp8: refactor decoding a single mb_row
17
         doc: update api changes with the right commit hashes
18
```

```
19
          mem: introduce av_malloc_array and av_mallocz_array
20
        Conflicts:
21
22
                configure
                doc/APIchanges
23
                libavcodec/vp8.c
24
                libavutil/mem.h
25
                libavutil/version.h
26
27
28
       Merged-by: Michael Niedermayer <michaelni@gmx.at>
```

為了確定該檔案是否有可能只是改名,過者遷移路徑,在此用另外一個指令繼續。 Git 追檔案更動

```
git log --full-history -- libavformat/output-example.c
```

最後發現被搬移至此 doc/examples/output.c , 更後面就沒有該範例的存在。

```
1 | libavformat/output-example.c - doc/examples/output.c
```

其 Log 的顯示於此。

```
commit ab81f24ad43bddf77ddd25cba86780c1c884996c
Author: Diego Biurrun <diego@biurrun.de>
Date: Sat Nov 2 17:05:28 2013 +0100

build: Integrate multilibrary examples into the build system

This includes moving libavformat/output-example to doc/examples/output.
```

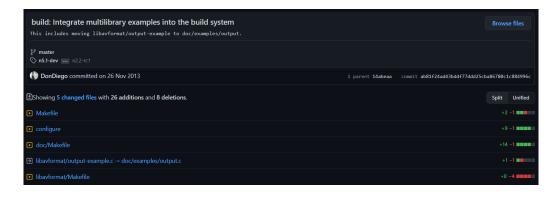

Fig. 5. GitHub 紀錄

Git Commit 滾動指令

```
git reset --hard HEAD^
git reset --hard [COMMIT]
```

綜上所述,目前遇到有兩個版本,一個是 doc/examples/output.c 最後版本,一個是 libavformat/output-example.c 在最後 v0.6 的版本。在此用 vim 進行對比。

```
1 vim -d output.c output-example.c
```

Fig. 6. Vim 行數對比

從上面可以看到 doc/examples/output.c 相對 libavformat/output-example.c 多了不少更進,在此,本作業用 doc/examples/output.c 版本進行分析。

5 output-example

5.1 output-example 作業項目

在此本作業在此針對 doc/examples/output.c 整理成一份檔名為 output-zh-read.c 的中文註解說明版本如下。而後分析都根據官方文件與專案程式碼。

https://github.com/kancheng/kan-cs-report-in-2022/blob/main/DMSASD/ffmpeg/output-zh-read.c

5.2 output-example 源代碼說明

該程式碼開頭為給使用者版權宣告註解與先前從 libavformat API example 遷移過來的說明。

```

24
    * libavformat API example.
25
26
    * @example doc/examples/output.c
27
    * Output a media file in any supported libavformat format.
28
    * The default codecs are used.
29
30
    */
```

再來就是該程式碼的 C 語言套件庫,部分包含常用的 stdlib.h、stdio.h、string.h、math.h。FFMPEG 自身的 Library,當中包含了 mathematics.h 數學處理包,與 AVFormat 有關的 avformat.h。跟比如將 YUV420P 轉換成 YUYV422 會用到的換圖大小 swscale.h。最後則是該程式會需要的巨集定義與相關的變數宣告

```
1
   // C Library
2
   #include < stdlib.h>
3
   #include < stdio.h>
4
   #include < string.h>
5
   #include <math.h>
6
7
   // FFMPEG Library
8
   #include "libavutil/mathematics.h"
9
   #include "libavformat/avformat.h"
10
   #include "libswscale/swscale.h"
11
12
   // 巨集定義
13
   /* 5 seconds stream duration */
14
   #define STREAM_DURATION
15
   #define STREAM_FRAME_RATE 25 /* 25 images/s */
16
   #define STREAM_NB_FRAMES ((int)(STREAM_DURATION * STREAM_FRAME_RATE))
17
   #define STREAM_PIX_FMT AV_PIX_FMT_YUV420P /* default pix_fmt */
18
19
   static int sws_flags = SWS_BICUBIC;
20
```

AVStream 為負責音源輸出與加入加入音源輸出的函式。當中有個尋找音頻編碼器會判斷,然後放入樣本參數,另外在一些 stream header 進行額外處理。

```
1 // 音源輸出
2 static float t, tincr, tincr2;
3 static int16_t *samples;
4 static int audio_input_frame_size;
5 /* 加入音源輸出
7 * add an audio output stream
```

```
8
   static AVStream *add_audio_stream(AVFormatContext *oc, enum AVCodecID codec_id)
 9
10
   {
11
        AVCodecContext *c;
       AVStream *st;
12
       AVCodec *codec;
13
   // 找到音頻編碼器
14
       /* find the audio encoder */
       codec = avcodec_find_encoder(codec_id);
16
        if (!codec) {
17
            fprintf(stderr, "codec not found\n");
18
19
            exit(1);
        }
20
21
        st = avformat_new_stream(oc, codec);
22
        if (!st) {
23
            fprintf(stderr, "Could not alloc stream\n");
24
25
            exit(1);
26
       }
27
28
       c = st->codec;
29
   // 放樣本參數
30
       /* put sample parameters */
31
       c->sample_fmt = AV_SAMPLE_FMT_S16;
32
                       = 64000;
33
       c->bit_rate
       c \rightarrow sample_rate = 44100;
34
       c->channels
35
36
   // 某些格式希望 stream header 是分開的
37
       // some formats want stream headers to be separate
38
39
        if (oc->oformat->flags & AVFMT_GLOBALHEADER)
40
            c->flags |= CODEC_FLAG_GLOBAL_HEADER;
41
42
        return st;
43
```

開啟音源函式部分,該函數會進行初始化。當中會有以每秒 $110~\mathrm{Hz}$ 的速度遞增頻率, $\mathrm{M_PI}$ 則是 FFMPEG 的 mathematics.h。

```
static void open_audio(AVFormatContext *oc, AVStream *st)

AVCodecContext *c;

c = st->codec;

/* open it */

if (avcodec_open2(c, NULL, NULL) < 0) {</pre>
```

```
9
            fprintf(stderr, "could not open codec\n");
            exit(1);
10
        }
11
12
13
        /* init signal generator */
              = 0;
14
        tincr = 2 * M_PI * 110.0 / c->sample_rate;
15
        /* increment frequency by 110 Hz per second */
16
        tincr2 = 2 * M_PI * 110.0 / c->sample_rate / c->sample_rate;
17
18
        if (c->codec->capabilities & CODEC_CAP_VARIABLE_FRAME_SIZE)
19
            audio_input_frame_size = 10000;
20
        else
21
22
            audio_input_frame_size = c->frame_size;
        samples = av_malloc(audio_input_frame_size *
23
                             av_get_bytes_per_sample(c->sample_fmt) *
24
                             c->channels);
25
26
```

get_audio_frame 準備 "frame_size" 樣本的 16 位虛擬音頻幀和'nb_channels' 頻道。

```
static void get_audio_frame(int16_t *samples, int frame_size, int nb_channels)
1
2
3
        int j, i, v;
4
        int16_t *q;
5
        q = samples;
6
7
        for (j = 0; j < frame_size; j++) {
            v = (int)(sin(t) * 10000);
8
            for (i = 0; i < nb\_channels; i++)
9
10
                *q++ = v;
                  += tincr;
11
            tincr += tincr2;
12
        }
13
14
```

write_audio_frame 則是進行編碼工作,pkt 的數據和大小初始必須為 0,其後將壓縮幀寫入媒體文件。

```
static void write_audio_frame(AVFormatContext *oc, AVStream *st)
1
2
       AVCodecContext *c;
3
       AVPacket pkt = \{ 0 \}; // data  and size  must be 0;
4
       AVFrame *frame = av_frame_alloc();
5
6
       int got_packet;
7
8
       av_init_packet(&pkt);
9
       c = st -> codec;
10
       get_audio_frame(samples, audio_input_frame_size, c->channels);
11
```

```
12
        frame -> nb_samples = audio_input_frame_size;
        avcodec_fill_audio_frame(frame, c->channels, c->sample_fmt,
13
                                  (uint8_t *) samples,
14
15
                                  audio_input_frame_size *
16
                                  av_get_bytes_per_sample(c->sample_fmt) *
                                  c->channels, 1);
17
18
        avcodec_encode_audio2(c, &pkt, frame, &got_packet);
19
        if (!got_packet)
20
21
            return;
22
23
        pkt.stream_index = st->index;
24
25
        /* Write the compressed frame to the media file. */
        if (av_interleaved_write_frame(oc, &pkt) != 0) {
26
            fprintf(stderr, "Error while writing audio frame\n");
27
            exit(1);
28
29
30
        avcodec_free_frame(&frame);
31
```

close_audio 為關閉音源。

```
static void close_audio(AVFormatContext *oc, AVStream *st)

avcodec_close(st->codec);

av_free(samples);
}
```

AVStream 部分為影像輸出部分,過程中會先找到影像的 encoder,而後放其參數,且設分辨率必須是二的倍數。而 timebase 這是表示幀時間戳的基本時間單位(以秒為單位)。對於固定 fps 內容,時基應為 1/幀速率,時間戳增量應等於 1。最後最多每十二幀發射一幀。同時為了需要避免使用某些係數溢出的宏塊。這不會發生在普通視頻中,它只是在這裡發生,因為色度平面的運動與亮度平面不匹配。另外為了測試添加了 B 幀。

```
static AVFrame *picture, *tmp_picture;
1
2
   static int frame_count;
   static AVStream *add_video_stream(AVFormatContext *oc, enum AVCodecID codec_id)
3
4
       AVCodecContext *c;
5
       AVStream *st;
6
7
       AVCodec *codec;
        codec = avcodec_find_encoder(codec_id);
8
        if (!codec) {
9
            fprintf(stderr, "codec not found\n");
10
            exit(1);
11
12
13
        st = avformat_new_stream(oc, codec);
        if (!st) {
14
```

```
15
             fprintf(stderr, "Could not alloc stream\n");
             exit(1);
16
17
18
        c = st -> codec;
        c -> bit_rate = 400000;
19
        c->width
                      = 352;
20
        c->height
                      = 288;
21
        c->time_base.den = STREAM_FRAME_RATE;
        c \rightarrow time_base.num = 1;
23
24
        c->gop_size
                           = 12;
                           = STREAM_PIX_FMT;
        c \rightarrow pix_fmt
25
        if (c->codec_id == AV_CODEC_ID_MPEG2VIDEO) {
26
             c \rightarrow max_b_frames = 2;
27
28
        if (c->codec_id == AV_CODEC_ID_MPEG1VIDEO) {
29
             c \rightarrow mb_decision = 2;
30
31
        if (oc->oformat->flags & AVFMT_GLOBALHEADER)
32
33
             c->flags |= CODEC_FLAG_GLOBAL_HEADER;
        return st;
34
35
```

AVFrame 為處理 AVCodecContext 的重要組成部分。

```
1
   static AVFrame *alloc_picture(enum AVPixelFormat pix_fmt, int width, int height)
2
       AVFrame *picture;
3
4
        uint8_t *picture_buf;
        int size;
5
6
7
        picture = av_frame_alloc();
        if (!picture)
8
9
            return NULL;
                    = avpicture_get_size(pix_fmt, width, height);
        size
10
        picture_buf = av_malloc(size);
11
        if (!picture_buf) {
12
            av_free(picture);
13
            return NULL;
14
15
        avpicture_fill((AVPicture *)picture, picture_buf,
16
17
                        pix_fmt, width, height);
18
        return picture;
19
```

open_video 為開啟影像函式,當中有一個 codec,同時分配編碼的原始圖片,同時如果輸出格式不是 YUV420P,那麼也需要一張臨時的 YUV420P 圖片。然後將其轉換為所需的輸出格式。

```
3
        AVCodecContext *c;
4
        c = st -> codec;
        if (avcodec_open2(c, NULL, NULL) < 0) {</pre>
5
            fprintf(stderr, "could not open codec\n");
6
            exit(1);
7
8
        }
9
        picture = alloc_picture(c->pix_fmt, c->width, c->height);
10
            fprintf(stderr, "Could not allocate picture\n");
11
            exit(1);
12
13
        tmp_picture = NULL;
14
        if (c \rightarrow pix_fmt != AV_PIX_FMT_YUV420P)  {
15
16
            tmp_picture = alloc_picture(AV_PIX_FMT_YUV420P, c->width, c->height);
            if (!tmp_picture) {
17
                 fprintf(stderr, "Could not allocate temporary picture\n");
18
                 exit(1);
19
20
            }
21
        }
22
```

fill_yuv_image 的函式為 dummy image 的處理,當中控制 Y 、Cb、Cr。

```
1
   static void fill_yuv_image(AVFrame *pict, int frame_index,
                                 int width, int height)
2
3
        int x, y, i;
4
5
        i = frame_index;
        for (y = 0; y < height; y++)
6
            for (x = 0; x < width; x++)
7
8
                pict -> data[0][y * pict -> linesize[0] + x] = x + y + i * 3;
        for (y = 0; y < height / 2; y++) {
9
            for (x = 0; x < width / 2; x++) {
10
                pict -> data[1][y * pict -> linesize[1] + x] = 128 + y + i * 2;
11
                pict -> data[2][y * pict -> linesize[2] + x] = 64 + x + i * 5;
12
            }
13
14
        }
15
```

write_video_frame 在此處理影像,不再需要壓縮幀。如果使用 B 幀,編解碼器有幾幀的延遲,所以我們通過再次傳遞相同的圖片來獲得最後一幀,由於該函式只生成一張 YUV420P 圖片,如果需要會將其轉換為編解碼器像素格式。而後面則是 encode 影像的處理。最後將壓縮幀寫入媒體文件。

```
static void write_video_frame(AVFormatContext *oc, AVStream *st)

int ret;
AVCodecContext *c;
static struct SwsContext *img_convert_ctx;
```

```
7
        c = st -> codec;
 8
        if (frame_count >= STREAM_NB_FRAMES) {
 9
10
        } else {
            if (c->pix_fmt != AV_PIX_FMT_YUV420P) {
11
                if (img_convert_ctx == NULL) {
12
                     img_convert_ctx = sws_getContext(c->width, c->height,
13
                                                        AV_PIX_FMT_YUV420P,
14
                                                        c->width, c->height,
15
                                                        c \rightarrow pix_fmt,
16
                                                        sws_flags , NULL, NULL, NULL);
17
18
                     if (img_convert_ctx == NULL) {
                         fprintf(stderr,
19
20
                                  "Cannot initialize the conversion context\n");
                         exit(1);
21
                     }
22
23
                fill_yuv_image(tmp_picture, frame_count, c->width, c->height);
24
25
                sws_scale(img_convert_ctx, tmp_picture->data, tmp_picture->linesize,
                           0, c->height, picture->data, picture->linesize);
26
            } else {
27
                fill_yuv_image(picture, frame_count, c->width, c->height);
28
29
            }
        }
30
31
        if (oc->oformat->flags & AVFMT_RAWPICTURE) {
32
            AVPacket pkt;
33
            av_init_packet(&pkt);
34
                              |= AV_PKT_FLAG_KEY;
35
            pkt. flags
            pkt.stream_index = st->index;
36
37
            pkt.data
                               = (uint8_t *)picture;
38
            pkt.size
                               = sizeof(AVPicture);
39
            ret = av_interleaved_write_frame(oc, &pkt);
        } else {
40
            AVPacket pkt = { 0 };
41
42
            int got_packet;
            av_init_packet(&pkt);
43
            ret = avcodec_encode_video2(c, &pkt, picture, &got_packet);
44
            if (!ret && got_packet && pkt.size) {
45
46
                if (pkt.pts != AV_NOPTS_VALUE) {
                     pkt.pts = av_rescale_q(pkt.pts,
47
                                             c->time_base, st->time_base);
48
49
                if (pkt.dts != AV_NOPTS_VALUE) {
50
51
                     pkt.dts = av_rescale_q(pkt.dts,
52
                                             c->time_base, st->time_base);
53
                }
```

```
pkt.stream_index = st->index;
54
                 ret = av_interleaved_write_frame(oc, &pkt);
55
            } else {
56
                 ret = 0;
57
58
            }
59
        if (ret != 0) {
60
            fprintf(stderr, "Error while writing video frame\n");
61
            exit(1);
62
63
64
        frame_count++;
65
```

close_video 關閉影像函式。

```
static void close_video(AVFormatContext *oc, AVStream *st)
1
2
3
        avcodec_close(st->codec);
        av_free(picture ->data[0]);
4
        av_free(picture);
5
        if (tmp_picture) {
6
7
            av_free(tmp_picture ->data[0]);
8
            av_free(tmp_picture);
9
        }
10
```

最後則是 main 函式,已開始會初始化 libavcodec,並註冊所有編解碼器和格式,並且從名稱中自動檢測輸出格式。默認為 MPEG,而後分配輸出媒體內文,最後使用默認格式編解碼器添加音頻和視頻流並初始化編解碼器。

當現在所有參數都設置好後,則可以打開音頻和視頻編解碼器並分配必要的編碼緩衝區。另外過程中有需要,可打開輸出文件,並寫入 stream header,計算計算當前的音頻和視頻時間,最後寫入交錯的音頻和視頻幀與關閉每一個 codec 跟輸出檔案。

```
int main(int argc, char **argv)
1
2
       const char *filename;
3
4
       AVOutputFormat *fmt;
       AVFormatContext *oc;
5
       AVStream *audio_st, *video_st;
6
       double audio_pts, video_pts;
7
       int i;
8
       av_register_all();
9
       if (argc != 2) {
10
            printf("usage: %s output_file\n"
11
                   "API example program to output a media file with libavformat.\n"
12
                   "The output format is automatically guessed according to the file
13
                        extension.\n"
                   "Raw images can also be output by using '%%d' in the filename\n"
14
                   "\n", argv[0]);
15
```

```
return 1;
16
        }
17
18
19
        filename = argv[1];

88
        return 0;
89
90
```

5.3 output-example 測試工作

在此使用 GCC 進行編譯,並針對 ffmpeg 0.5.13 的版本進行測試。架設過去的 Linux 跟 GCC 按照當時的技術文件進行還原。

```
# 下載早期版本
1
   # wget http://www.ffmpeg.org/releases/ffmpeg-0.5.13.tar.bz2
2
3
   # 解壓縮
4
   # tar -jxvf ffmpeg-0.5.13.tar.bz2
5
6
7
   # vim ffmpeg_configure.sh
8
   ./configure \
   --prefix=/YOUR_INSTLL_DIRECTORY \
9
   --enable-gpl --enable-nonfree --enable-version3 \
10
   --enable-swscale --enable-avfilter
11
```

```
12 --enable-pthreads
13 【保存并退出】
```

進入目錄用 vim 建立 ffmpeg_configure.sh , 完成後退出。

```
1 # vim ffmpeg_configure.sh
```

```
1    ./configure \
2    --prefix=/YOUR_INSTLL_DIRECTORY \
3    --enable-gpl --enable-nonfree --enable-version3 \
```

4 --enable-swscale --enable-avfilter \

5 --enable-pthreads

改變權限後用 make

```
1 # chmod +x ffmpeg_configure.sh
2 # ./ffmpeg_configure.sh
3 # make
4 # make install
```

將安裝目錄""下的

YOUR_INSTLL_DIRECTORY/include YOUR_INSTLL_DIRECTORY/lib 打包,就可以生成一個開發用的 SDK

```
1 | # tar -czvf YOUR_INSTLL_DIRECTORY/ ffmpeg_sdk.tar.gz
```

引入後編譯,解决:

```
# gcc output_example.c -o output_example

I/opt/ffmpeg/sourcecode/ffmpeg-0.5.13.install/include

-L/opt/ffmpeg/sourcecode/ffmpeg-0.5.13.install/lib

-lavformat -lavdevice -lavcodec -lavutil -lavfilter

-pthread -ldl -lswscale -lbz2 -lasound -lz -lm
```

運行

```
1 # ./output_example xxx.flv
```

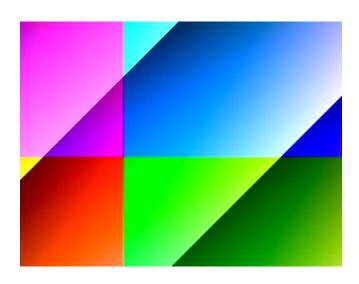

Fig. 7. output-example 測試結果

6 MUXING.C 測試工作 19

6 muxing.c 測試工作

後來經過調研才發現類似的 Code 於此,其測試內容於之前雷同,但是這回使用 Mac。

Fig. 8. muxing.c 目錄

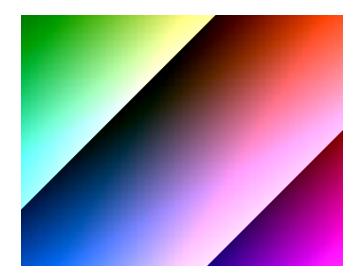

Fig. 9. muxing.c 測試結果
